

BUILD YOUR FIRST AI ASSISTANT WITH PYTHON

Register Now

Course Structure

Lecture 0: The Engine (Python Fundamentals)

- **Thinking Computationally:** Why Python is the language of AI
- **Syntax & Semantics:** Variables, Data Types (Strings, Integers), and formatting text
- **Control Flow:** if/else logic and for loops
- **Functions:** Abstracting code into reusable blocks
- **Practical:** Build a programmatic greeting system

Lecture 1: The Bridge (APIs & JSON)

- **Network Requests:** How code talks to the internet (Client-Server model)
- **The requests Library:** Fetching data programmatically
- **Data Parsing:** Understanding and navigating JSON structures
- **Practical:** Fetch live, real-world data using a public endpoint

Lecture 2: The Brain (Generative AI Integration)

- **LLM Architecture:** A high-level look at how Generative AI processes text
- **API Security:** Best practices for handling private keys (Google Colab Secrets)
- **The Gemini Connection:** Authenticating and sending prompts to the AI via Python
- **Practical:** Build a programmatic "Text Summarizer"

Lecture 3: Problem Set 0 (Final Project & Certification)

- **The Challenge:** Build an interactive Command-Line Chatbot
- **Deployment & Security:** Secure your keys, save your outputs, and submit your Colab Notebook for verification

Part 2: The Google Classroom Final Assignment

Assignment Title: Problem Set 0: The Terminal Assistant

Background: Welcome to your final challenge! You have just been hired as a Junior AI Engineer at a tech startup. Your first task is to build a Command-Line AI Assistant that can answer questions for the company's users. It must be built in Python, it must interact with a real AI API, and above all, it must be secure.
